# 1 Installation

Brookesia is developed under the informatic language Python 3. It can be used on Linux, macOS, and Windows.

The necessary computations for the reduction procedure are done with the open-source Cantera software toolkit. The first step is thus to install it.

## 1.1 Cantera

Every necessary information for the installation of Cantera are provided on Cantera website :

<https://www.cantera.org/install/conda-install.html>

## 1.2 Brookesia

At the moment, Brookesia do not need installation. The only thing you need to do is to download the source files and use it properly !

### 1.2.1 Through command line on Linux and Mac

On a terminal, go to your future reduction working folder then type:

```
git clone https://github.com/Brookesia-py/Brookesia
```

### 1.2.2 By downloading the software on Github

1. Go to the following webpage  
<https://github.com/Brookesia-py/Brookesia>
2. click on **Clone or download** button then **Download zip**
3. unzip the downloaded file on your future working folder

After that, all source files shall be on your working folder and you can directly start to work !

## 2 Basic usage

Before using Brookesia, make sure your Cantera environment is activated. On linux, type on a terminal:

```
source activate <path_to_cantera_environment>
```

### 2.1 Input file creation through the Graphic User Interface

On **Spyder** (normally installed with the Anaconda suite), load the file `GUI_red_mech.py` and run it. On command line, on Brookesia folder, just type:

```
python GUI_red_mech.py
```

Then, proceed to the following steps to operate a mechanism reduction (see the screen shots in Table 1):

On the **Main parameters** tab:

1. Load the kinetic mechanism  
Example: C1\_GRI30.cti  
*Note: It is possible to load a previous input file by clicking on **load file** button*
2. Select the target species  
Example: CH<sub>4</sub>/CO/CO<sub>2</sub>
3. Select the reduction methods you want to apply  
Example: DRGEP\_sp + SA\_r  
→ then new tabs must appear
4. Select the errors options (pts/QoI ; max/mean)
5. On the **Conditions** tab:  
Define the canonical configurations you want to run  
Example: Reactor (H,p) CH<sub>4</sub>/air  $\Phi = 0,5/1/1,5$   $p = 10^5$ Pa;  $T = 1600$  K  
see XX for more details
6. On the **reduction** tab:  
define all the options you want to specify (see XX for details)
7. On the **GA** tab (if so):  
define all the options you want to specify (see XX for details)
8. On the **Main parameters** tab:  
If necessary:
  - change the condition name and save it by clicking on the button Save current conditions  
Example: First\_example.inp → then saved in the \_condition\_input folder
  - change the folder name  
Example: First\_example\_folder *Note: to this will be added the date and the hour of reduction (i.e. here 20191225\_1200\_First\_example\_folder)*
  - change the amount of outputs during the reduction process (verbose /show plot during reductions)

Run the reduction by clicking on **RUN** button

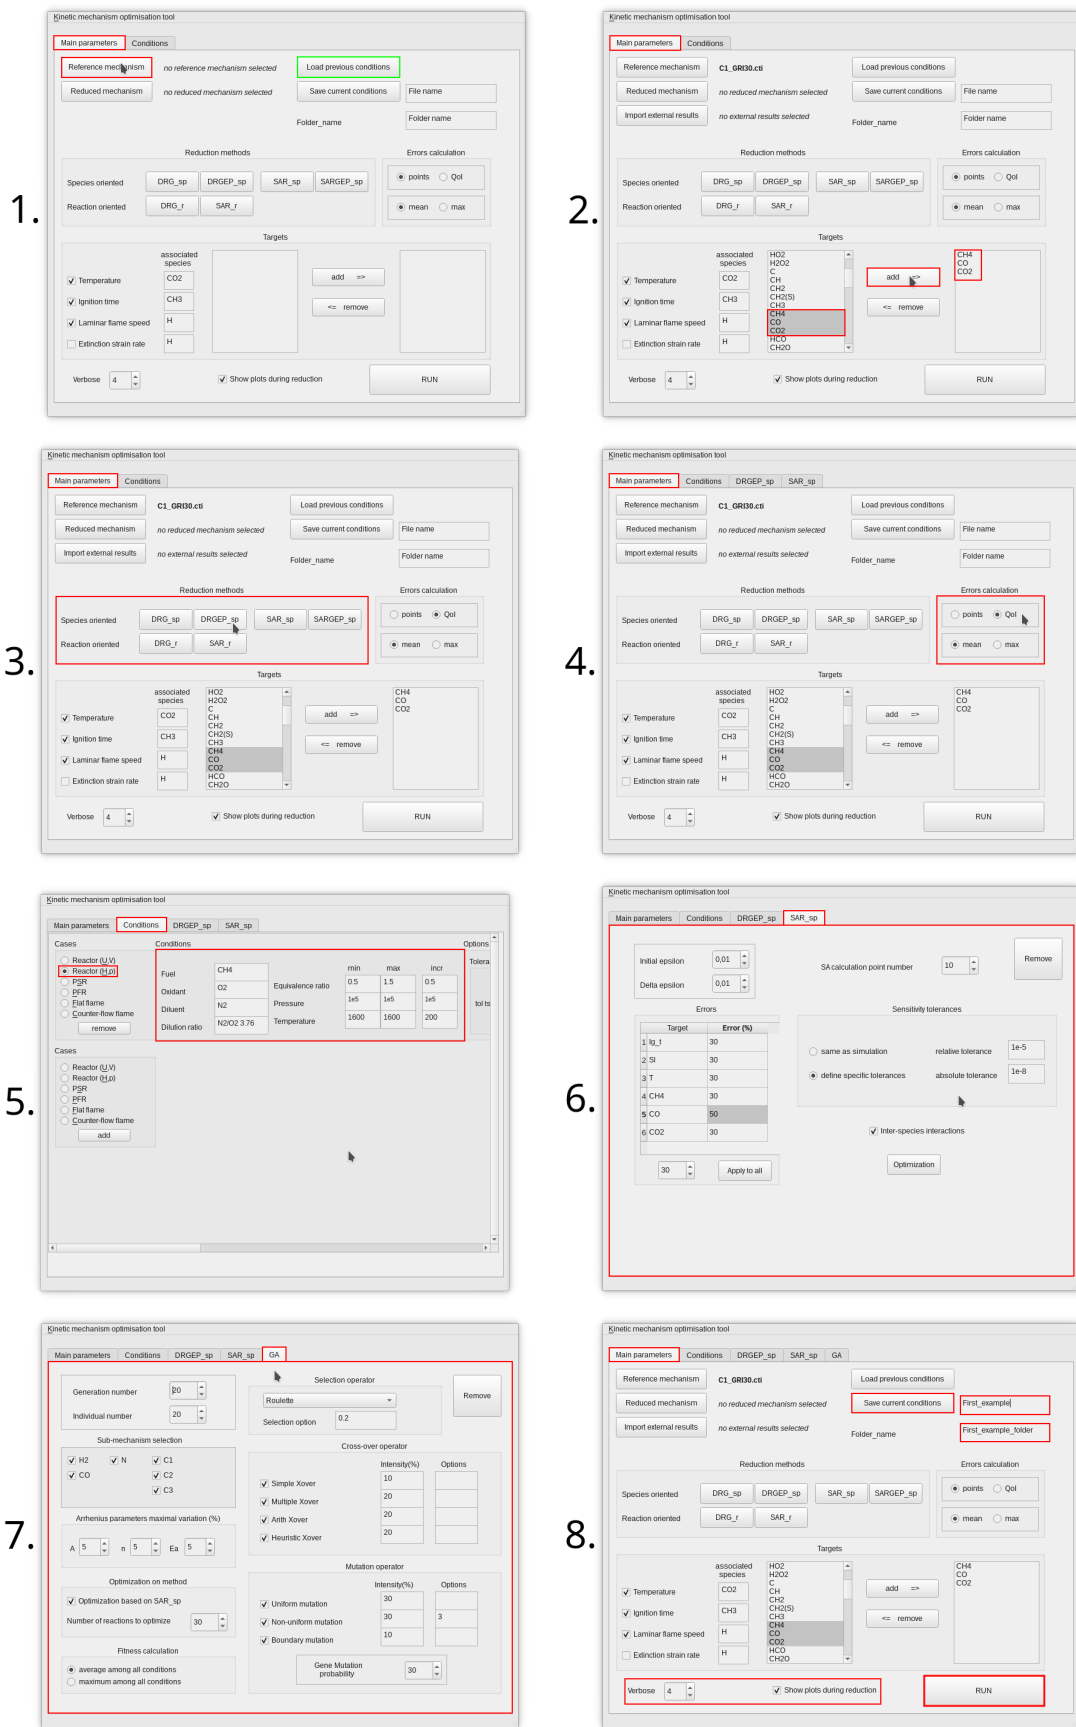

Table 1: Successive usual steps for the reduction and optimization of a kinetic mechanism

## 2.2 Input file modification on a text editor and tips

Input files (presented in appendices) are usually stored in the `_condition_input` folder. They are composed in three steps :

- ```
##=====
#           Main parameters
##=====
```

Corresponds to the informations displayed in "*Main parameters*" tab in GUI. Note: several species can be associated to the global data *T*, *igt*, *Sl*, and *K*. To do that just separate the associated species by a coma, i.e.

```
sp_T           = CO2, CO
```

- ```
##=====
#           Simulation cases
##=====
```

Note: instead of entering fuel, oxidant, diluent, options, you can enter the mixture in the cantera format using "mixt" option (and "mixt2" for counterflow burner configurations), i.e.

```
mixt           = CH4:0.1 , O2:0.1 , N2:0.8
```

- ```
##=====
#           Operators
##=====
```

Corresponds to the informations displayed in "*Reduction operator*" and "*GA*" tabs in GUI. Note: if the number of values provided for the tolerance limit of target species is lower than the number of target species, only the first value will be retranscribed and applied to target species. Thus, if you want to define a tolerance threshold of 30% for all target species, you only need to enter the value 30 after the `max_error_sp` keyword, i.e.:

```
max_error_sp   = 30
```

An example of input file and the corresponding keyword dictionary are presented in appendices

## 2.3 Running Brookesia from command line

From the head of the working folder, type:

```
python main_reduction.py _conditions_input/<name_of_the_input_file>
```

The argument "`_conditions_input/<name_of_the_input_file>`" is the path toward the reduction condition input file.

## 2.4 Focus on reduction and optimization options

### • Reduction options :

For all reduction methods, you can specify:

- The starting epsilon,
- The starting delta epsilon that will be applied between each iteration (subject to change during the reduction process)
- The number of calculation points distributed in each simulation
- The target tolerances
- The Inter Species Interactions loop
- The optimization after the reduction, if so, a new tab will appear

To facilitate the sensitivity analyses, it is possible to modify the tolerances (in the present example, relative/absolute tolerances are fixed at  $10^{-5}/10^{-8}$ , respectively)

### • Optimization options:

On the genetic algorithm tab, you can specify:

- the number of generation, of individuals,
- the sub-mechanism to optimize
- the variation range of reaction rate coefficients B,n and C
- to constrain the reduction method to the important reactions identified during the reduction
- to define the fitness computation depending on the average error or the maximal error (among all targets and conditions)
- the selection method
- the cross-over method and corresponding intensity
- the mutation method and corresponding intensity. The gene mutation probability define the reaction probability to get its reaction rate coefficients modified

(a) Reduction tab, example of SAR

(b) Genetic algorithm tab

Figure 1: Results file main sections composition

### 3 Output files

The reduction shall now take place. If the calculations are operated on spyder and the option *Show plots during reduction* has been selected, you can follow the accuracy of the reduced models on the graphs displayed on the spyder console (see figure XX. a).

Once the reduction is finished, you can check the results on the new folder [date\_time\_name\_of\_the\_folder], (here: 191225\_1200\_First\_example\_folder). It contains the following elements:

- **File.** Conditions\_redopt.inp: the input file of the reduction
- **File.** \*.cti: the reference mechanism (here: C1\_GRI30.cti)
- **File.** red\_info.txt: contains informations of the reduction process
- **File.** X\_reduction\_results.csv: contains the simulation results of the *X* reduction step (here, 0\_reduction\_result.csv for the DRGEP\_sp step and 1\_reduction\_result.csv for the SA\_r step). See details, hereafter.
- **Folder.** Flame\_ref\_results (if so): store the \*.xml reference flame results used for *restore* cantera option to accelerate the new mechanism simulations
- **Folder.** Red\_mech: contains the reduced and optimized step named as follows: X(opt)\_B.cti where *X* represent the step number, (opt) is a character string added for the optimized kinetic mechanism, *B* is the reference mechanism name.

In the present example, the kinetic mechanism created are:

- 1\_C1\_GRI30.cti: reduced mechanism after DRGEP\_sp step
- 2\_C1\_GRI30.cti: reduced mechanism after SAR\_sp step
- 2opt\_C1\_GRI30.cti: optimized mechanism after genetic algorithm step

Simulation results are organized on a \*.csv file as presented in Figures 2. The first part of the file (a) indicate information concerning the reference mechanism, the reduction method and, if so, the genetic algorithm. The main information concerning the conditions of the simulation cases (canonical configuration, mixture composition, pressure, temperature, simulation tolerances, etc.) are reminded and the results of the reference simulation are provided. As indicated, in the Figure 2 b), after the reference results, the simulation results obtained with the reduced mechanism and, if so, the optimized mechanism are given. Error information are also provided.

| Kinetic mechanism information    |                                             |                   |                  |                      |                      |                      |                   |                      |                |
|----------------------------------|---------------------------------------------|-------------------|------------------|----------------------|----------------------|----------------------|-------------------|----------------------|----------------|

## 4 First examples

Five input files are provided for a gentle start with Brookesia software. Input conditions are summarized in Table 2.

| Input file name          | 1_reactor.inp                                                                | 2_JSR.inp                                                         | 3_Free_Flame.inp                                                            | 4_diff.inp                                                               | 5_pp.inp                                                          |

Table 2: Summary presentation of the five input files provided as examples  
targets symbols:  $T$ : temperature,  $igt$ : ignition delay time,  $Sl$ : laminar flame speed,  $K$ : Extinction stretch rate

As an example, the results obtained with the successive kinetic mechanisms simulation of the reduction procedure given in 1\_reactor.inp are presented in Figure 3.

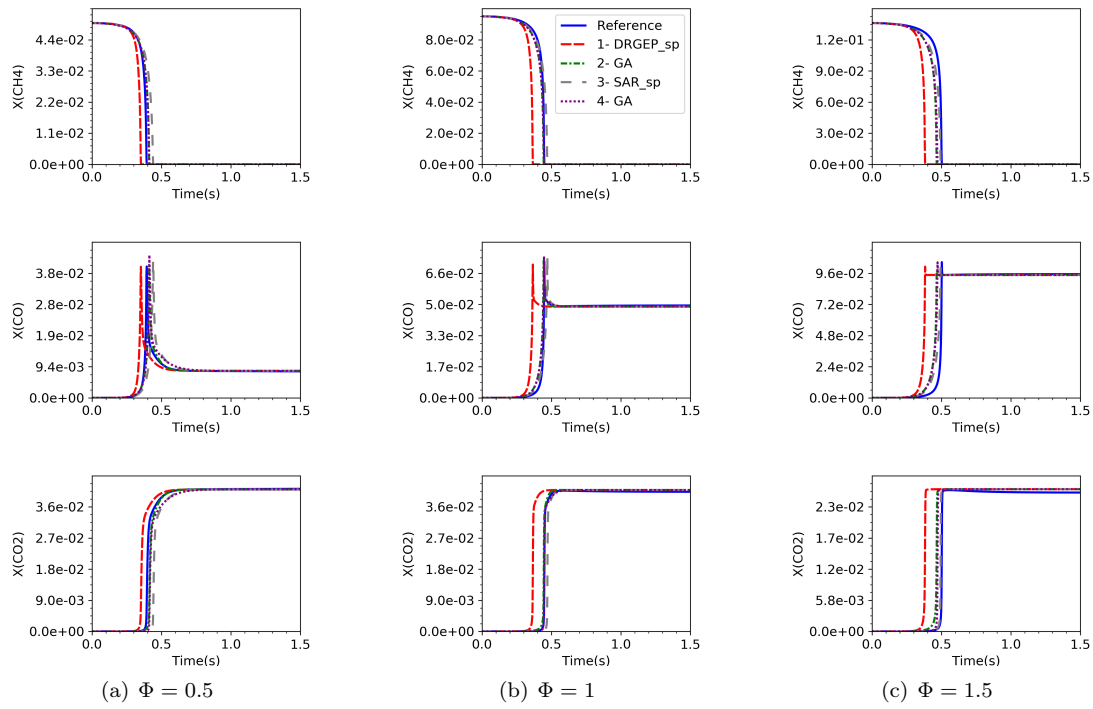

Figure 3: Simulation results obtained during the reduction process defined in the example 1\_reactor.inp

## Input file keyword dictionary

### Main parameters keywords

|                   |                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------|
| main_path         | name of the folder containing all results (to this will be added the date and the hour of reduction) |
| mech              | reference mechanism name                                                                             |
| verbose           | rules the amount of information displayed during the reduction process (range between 0 and 10)      |
| show_plots        | for spyder essentially, select to display or not the simulation results during the reduction process |
| tspc              | name of target species                                                                               |
| T_check           | add (True) or not (False) the temperature as target                                                  |
| sp_T              | temperature associated species to manage reduction with DRG methods                                  |
| Sl_check          | add (True) or not (False) the flame speed as target                                                  |
| sp_Sl             | flame speed associated species to manage reduction with DRG methods                                  |
| ig_check          | add (True) or not (False) the ignition delay time as target                                          |
| sp_ig             | ignition delay time associated species to manage reduction with reduction methods                    |
| K_check           | add (True) or not (False) the extinction stretch rate as target                                      |
| sp_K              | extinction stretch rate associated species to manage reduction with reductions methods               |
| error_calculation | error method (point / QoI)                                                                           |
| error_coupling    | error interpretation (max / mean)                                                                    |

### Configuration keywords

|                 |                                                                                      |
